Papros: Non Fungible Tokens for the Supply Chain to Revolutionize PLM Data Gathering

San Jose, California 26 July 2021– Papros Inc, a leader in supply chain management has created a process for supply chain actors to create NFTs (Non Fungible Tokens) to uniquely and immutably authenticate their data.

Multiple regulatory requirements require companies to have to release data on their products. Authenticatable distribution of the data creates bottlenecks and custom solutions of distribution of the data are needlessly cost ineffective. By creating NFTs, for example, of a company's entire product line comprising of all compliance information means this information can reliably distributed by any means, without worries of the global network insecurity and its effect on the data. This is because the data can be easily checked on the blockchain created for that. In addition, only those authorized to possess the data will be able to check it- this is where this is more advantageous than a simple website distribution.

It is no wonder that Papros platform is known universally being a platfom that enables companies to continue to relentlessly ensure their supply chain is not tainted in origins. Currently, that latest version has been optimized even further for ease of implementation and operation by offering many alternatives for users.

About Papros Inc: Papros Inc. has been committed to providing Total Environmental Management solutions to US and International companies. "Optimizing the Greenback and the Green Environment" has been the slogan of Papros Inc. since its inception more than thirty five years ago.
