

Hybrid Cloud Assisted Community Trash Abatement Programs (HyCACTAPs):

HyCACTAPs work by making trash abatement a very easy matter. It uses commercial cloud to gather data from any community member, and makes the data actionable by enabling the viewing of summary status of trash conditions among those authorized to view such data. This allows for efficient abatement of trash in communities.

The following is a simple set of steps to follow:

1. Get a free or paid for Dropbox account.
2. Register and Sign into <https://www.paprosinc.com/login.php> and buy a midlevel annual license for \$599 (less that \$50 a month)*.
3. Create a folder in Dropbox to receive trash reports.
4. From paprosinc site, do a one time authorization for access to Dropbox.
5. Then in paprosinc, set the remote folder to the one set in Dropbox, by following instructions on how to set it using link.
6. Set a 8- or higher character “persona” - a address in paprosinc that people can upload trash reports to.
7. Then anyone can click the link to creating a trash report in paprosinc site, and in the window next to the submit button, they would enter the persona address created if available to them.
8. The account administrator can use the paprosinc site and point to the remote folder and view a status summary that has good visuals to denote areas needing priority action.

Other commercial clouds can be serviced by custom licenses, contact paprosinc through the online help desk.

*- Large communities may cost higher.
